

Key-Value Observing (KVO)

It's kinda like a cross between KVC and NSNotification

First, the interested object must register as an observer of given property.

The Receiver must implement “observeValueForKeyPath”

```
-(void) observeValueForKeyPath:(NSString *)keyPath  
    ofObject:(id)object  
    change:(NSDictionary *)change  
    context:(void *)context  
{  
  
    //custom implementation  
    //be sure to call the superclass' implementation  
    //if the superclass implements it  
  
}
```

The object will then receive callback notifications when the value changes.

```
[bankInstance setAccountBalance:50];
```
